

Getting started with the Sensor Troubleshooting Hub

Open mihirsethidp.github.io/InternalTool on your phone or computer and sign in with your @digitalpaani.com email. Forgot your password? Use *Forgot password?* or *Email me a one-time code* on the sign-in page. New here? Ask an admin to invite you.

Tap the  icon in the top bar to switch the app's language (English, हिन्दी, বাংলা, मराठी, తెలుగు, தமிழ், ગુજરાતી, ಕನ್ನಡ), enlarge text, or turn on high contrast.

Fixing a sensor problem

Ask Dr. Paani — the fastest way

Dr. Paani is the assistant on the home page — “*Sensor acting up? Let’s diagnose it together.*” Type what’s wrong **in your own words**. All of these work:

- “senser not working” (*spelling mistakes are fine*)
- “pH reading keeps changing”
- “meter kharab hai”

Dr. Paani will do one of four things:

- **Walk you through it step by step** — answer its questions by tapping the buttons (Yes / No / Done / That didn’t work) and follow along.
- **Ask what the sensor is doing** — tap the option that matches, or type it.
- **Ask which sensor it is** — tap the type, brand, and model. Not sure? Pick just the type; general guidance still works.
- **Answer with sources** — every answer cites the exact document it came from. Tap a source to read the original.

When someone else is needed

Some problems need an electrician, the vendor, or a person authorized to switch equipment. Dr. Paani shows **who to contact and how to reach them** — pick the person listed for *your* plant. You can also tap **Log a support ticket** so the issue is recorded.

After every answer, tap Solved or Didn’t help. This genuinely improves the tool — unanswered questions are reviewed and turned into new guidance.

Reading a sensor reference

Open any sensor reference to read its consolidated guidance. Tap  to set a comfortable **text size, typeface, and background** (white, sepia, or dark) — like an e-reader. A progress bar tracks how far you’ve read.

Searching directly

- **Home search bar** — type a model number, brand, or problem.
- **Browse** — filter every document by type, category, or brand.
- **Sensors** — the full catalog; open any sensor to see everything we have.

If nothing matches, Dr. Paani can **search the web** for you — web answers are clearly marked *unverified*, so double-check before acting.

Adding documentation

1. Tap **Upload** in the top bar and pick the PDF (manual, datasheet, procedure...).
2. Choose the **document type** and the **sensor** it belongs to (brand + model).
If the sensor isn't listed, add it right there.
3. Submit. Your file goes to the review team — it is **not** public yet.
4. Track progress under **Uploads**. You'll get a notification on every decision.

Pending	waiting for review
Changes requested	open it, read the reviewer's note, fix, resubmit
Approved	merged into the sensor's reference — searchable and used by Dr. Paani
Rejected	the note explains why

Good uploads: original vendor PDFs, one document per file, correct brand and model. The clearer the source, the better Dr. Paani's answers.

Running the tool

Everything lives under **Admin** in the top bar.

Review queue

- Read the extracted text (edit it if the PDF scanned badly).
- Heed the **AI match banner** — it warns when a document looks filed under the wrong sensor or category — and the **duplicate warning**.
- **Approve** into the right activity section (Install, Configure, Clean, Calibrate, Troubleshoot & Repair...), **request changes**, or **reject**. The uploader is notified automatically.

Diagnostic flows — what powers the step-by-step walks

- Every approval **auto-drafts** 1–3 diagnostic flows from the new content; a badge shows drafts awaiting review.
- Open a draft, read the tree (Ask → Do → Fixed / Escalate), edit any step's wording, then **Approve**. Only approved flows reach users.
- **Generate with AI** back-fills flows from any existing document.

Escalation directory — who Dr. Paani tells users to call

Tap a skill (electrical engineer, vendor support, equipment access...) to add people: a **Default** used everywhere, **plant-specific** people, and **make-specific** vendor contacts. Keep names and phone numbers current — field technicians see these mid-diagnosis.

Invite teammates

In **Users**, use **Invite a teammate**: enter their work email and role (viewer, uploader, or admin). They receive an email link and set their own password on arrival.

Recycle bin — deletions are reversible

Deleting a reference or submission moves it to the **Recycle bin**, where it stays for **30 days**. Restore brings it back complete (search and Dr. Paani included); **Delete forever** is available inside the bin. After 30 days, items are removed automatically.

Routing rules, insights, and taxonomy

- On each sensor's page: **Generate with AI**, then approve the problem → procedure rules that look right.
- **Insights** shows "Didn't help" feedback, unanswered questions, and web-search usage — your guide to what documentation to add next.

- Manage accounts, categories, and document types in the matching tabs.
Roles: **Viewer** (search, browse, ask), **Uploader** (+ submit documents),
Admin (everything).

QUICK ANSWERS

Common questions

QUESTION	ANSWER
The chatbot didn't understand me	Tap one of the buttons it offers, or add the sensor's brand or model to your message
Can I type in Hindi / Hinglish?	Yes — "meter kharab hai" works; app menus also switch language (🌐 menu)
The answer was wrong or unhelpful	Tap Didn't help — admins review every one
Who sees my uploads?	Only reviewers until approved; then everyone
Nothing matches my search	Ask Dr. Paani — it can search the web (marked unverified) or log a ticket
Is the AI making things up?	No — answers come only from approved documents and cite their sources; when it doesn't know, it says so
